Causal Discovery in Stock Return

— Ensemble Deep Learning for Stock Return Prediction in Volatile Markets

Introduction

- Financial market volatility is driven by **economic conditions**, **corporate shocks**, **investor anticipations**, **global policies**, and **economic disruptions**, making stock return forecasting challenging.
- Capturing **long-term trends** and **external shocks** is crucial for informed investment decisions.
- Traditional models struggle with **sudden market shifts** due to reliance on historical patterns.
- Deep learning models, while more accurate, **lack interpretability**, limiting their adoption in finance.
- **Company List:** Amazon(AMZN), Google(GOOG), AT&T(T), Abbott Laboratories(ABT), Amgen(AMGN), CVS Health Corporation(CVS)

To enhance model transparency and reliability, we proposed a **hybrid** stock return prediction framework that 1) uses **PCMCI+ with DeepAR** for **causal feature selection** and **lag optimization** to better capture general daily trends and 2) leverages **CD-NOD** on real-time **macro-economic** and **company-level factors** with Random Forest to capture the effect of shock on stock price.

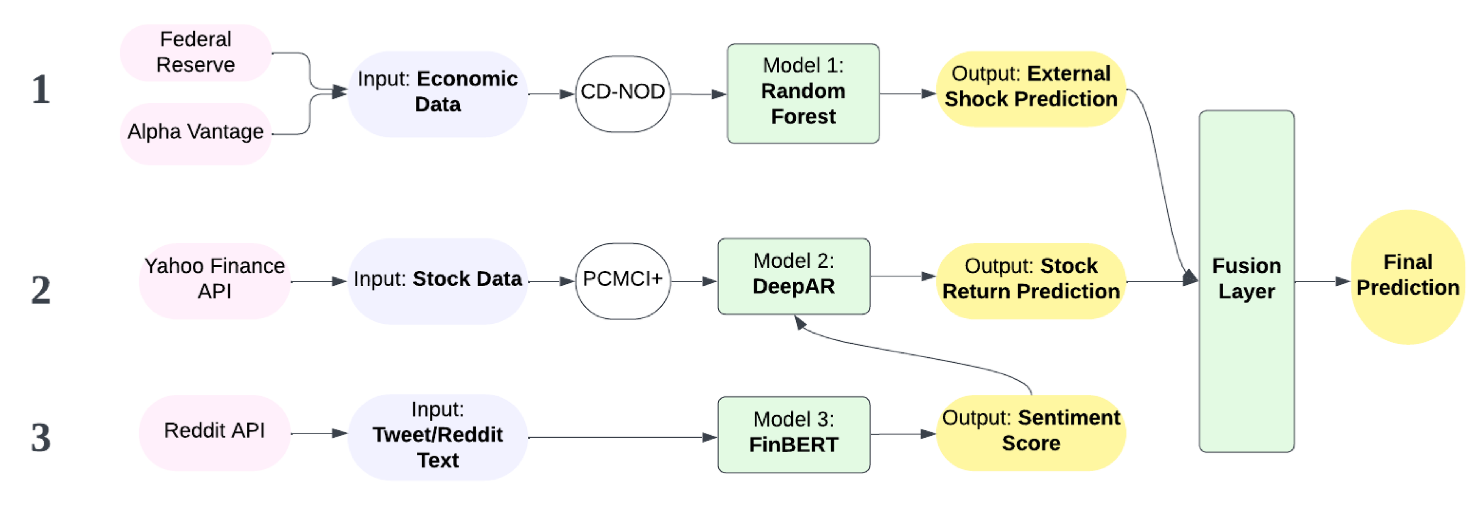

Fig. 1: Overview of the Proposed Stock Return Prediction Framework

1. Economic Impact Analysis Module

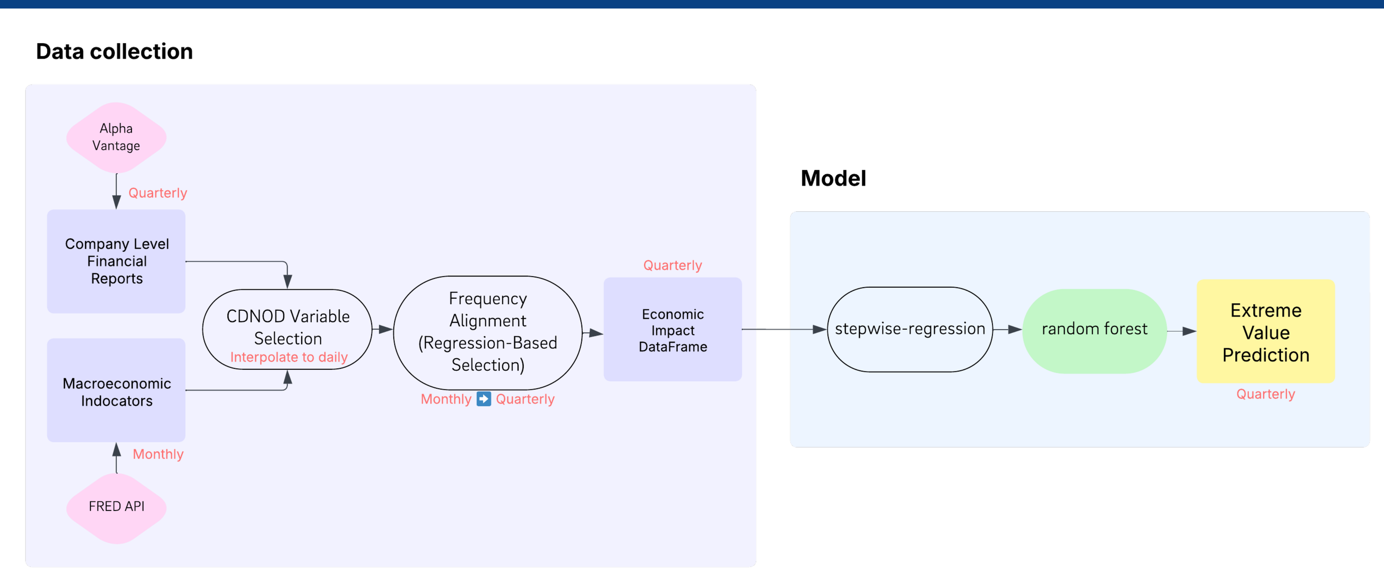

Fig. 2: Economic Impact Framework

Data Collection

- **Microeconomic Data** Company quarter reports (balance sheet, cash flow).
- **Macroeconomic Indicators** Monthly Economic data (CPI, GDP).

Frequency Alignment: We mapped each quarter to three monthly time-series vectors and then **regressed the monthly vector on the quarterly compound return**, selecting the most representative month via **hypothesis testing on the coefficients**.

Prediction Model: **Random Forest** predicts **extreme quarterly stock returns upon the release of company financial statements**, to capture shocks driven by economic fluctuations and expectations.

CDNOD: Feature Selection from a Causal Lens

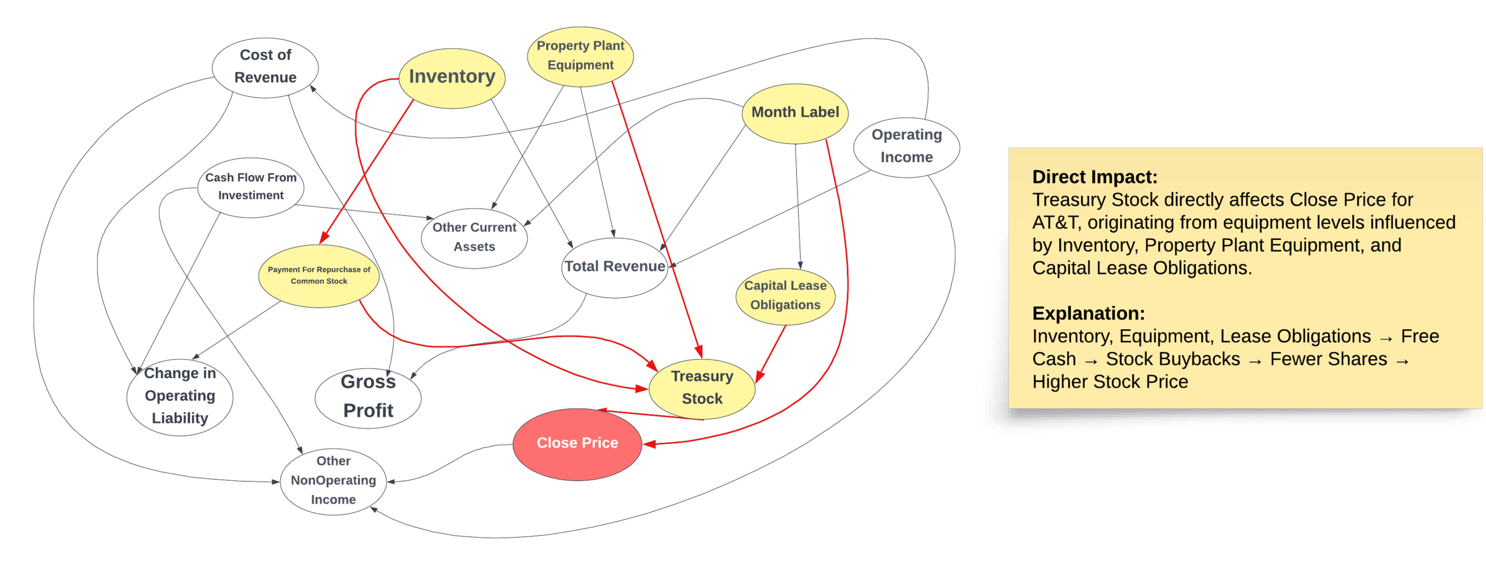

Fig. 3: Causal Graph for AT&T

After interpolating economic factors with daily stock prices, we applied **CD-NOD with monthly grouping and Fisher's Z-test at a 0.01 significance** level to capture causal relationships between factors and stock price shocks.

Defining impactful features

- have a **direct edge** to stock price.
- connect to stock price through **causal pathways** in the learned graph.

We further performed **pairwise regression** to assess each predictor's direct impact.

2. Stock Return Prediction Module

Data Collection & Pre-processing: We use historical data of 6 companies (3 Tech, 3 Healthcare) from Jun 2020 to Feb 2025, including daily metrics of opening/closing price, high, low, and volume. We calculate Daily return as: $R_t = \frac{P_t - P_{t-1}}{P_{t-1}}$.

Causal Feature Selection: Applied PCMCI+ algorithm for causal feature selection, identifying 8 key covariates based on their causal impacts.

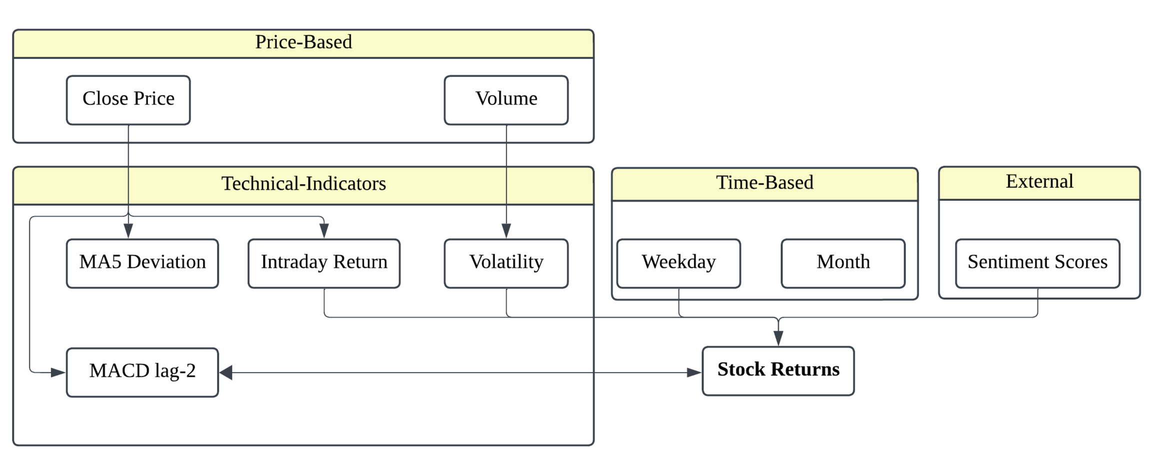

Fig. 4: Causal Structure of Stock Return Predictors after PCMCI+ Analysis

Model Architecture: The model integrates historical returns, technical indicators, and entity embeddings into a concatenated input tensor. An enhanced LSTM with skip connections and variational dropout enables robust gradient flow. The probabilistic output layer generates a Gaussian distribution of future returns, instead of just point estimates.

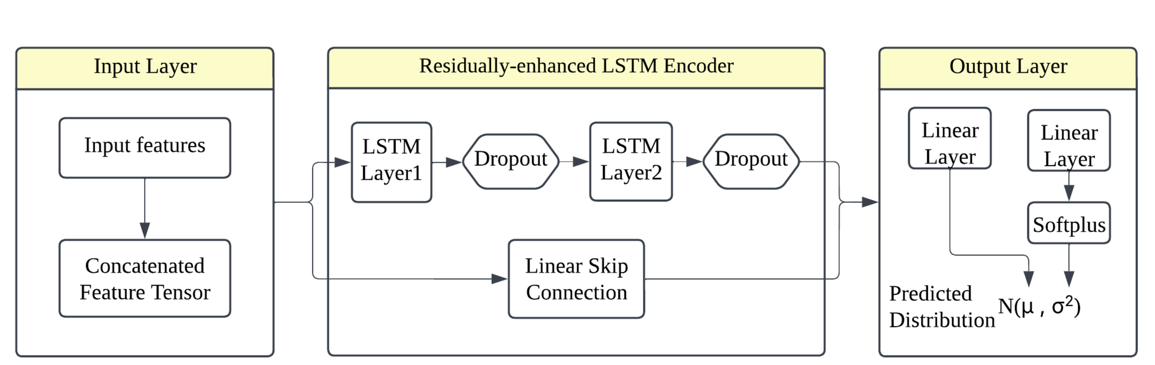

Fig. 5: DeepAR Model Pipeline

3. Sentiment Analysis Module

Model: FinBERT - Specialized NLP model for financial text sentiment analysis.
Data Collection & Pre-processing:

- AMZN, GOOG, CVS GitHub Tweet Dataset (June 2020 - May 2023).
- Collected Reddit posts and comments for additional sentiment data via API.
- Applied time-scaled linear interpolation for data smoothing.

Sentiment Scoring: Weighted FinBERT confidence levels with normalization to 0-1 range.

Fusion Layer and Final Results

Fusion Layer architecture: This integrates DeepAR daily predictions with quarterly financial data through an adaptive weighting mechanism, improving stock price forecasting accuracy.

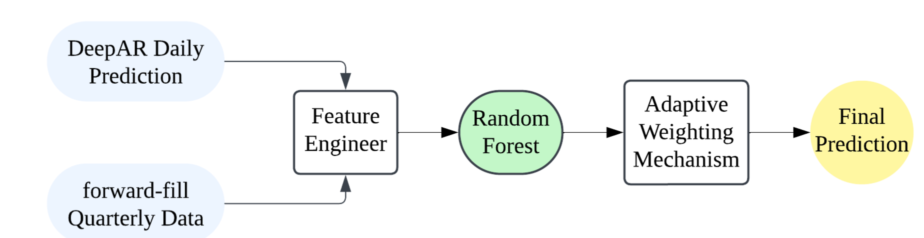

Fig. 7: Fusion Layer Architecture

Evaluation Metrics: MAE, MAPE, RMSE, and Direction Accuracy.
Our model captures market trends effectively, with ABT stock showing 100% direction accuracy and AT&T achieving exceptional short-term precision (MAE: $0.57).
